

Ensure Your Home is Electrically Safe

Home owners: Determine the electrical safety of your home.

Home sellers: Increase the selling price of your home.

Home buyers: Find out the hidden costs for electrical repairs.

1. What is a PowerCheck Home Electrical Safety Assessment?

- It is an 80-point safety check of the electrical system in your home — *a comprehensive examination, from service conductors to receptacles.*
- It presents a “Risk Assessment” of your home electrical system — *homes are rated Extreme, High, Medium or Low Risk.*
- It presents a list of “Corrective Actions” — *steps required to bring home to Low Risk.*

2. How long does the Home Electrical Safety Assessment take?

Average time: 1 hour; allow up to 90 minutes

3. Can I obtain “low-risk” rating with original “knob-&-tube wiring” in my home?

- Absolutely yes—if the “knob-&-tube wiring” is confirmed safe by PowerCheck.
- If there are any safety concerns, PowerCheck will identify where the issues are. Once they are repaired and any issues addressed, the home will be re-rated at respective lower risk.

4. Following upgrade repairs, does the home need to be re-inspected by PowerCheck?

No. Providing the document “Corrective Actions” has been signed-off as completed, by a licensed electrical contractor, the home is automatically re-rated at the respective lower risk. It is up to the customer to present this document to their insurance provider.

Hundreds of happy customers...
